FACULTY MENTOR DEPARTMENT

Obstetrics & Gynecology

RESEARCH PROJECT DESCRIPTION

This will be a descriptive study of long-term outcomes of patients with chronic pelvic pain following laparoscopic surgery and excision of endometriosis. The study involves data analysis (working with a biostatistician) and preparing manuscript and abstract for presentation and poster for MSRP celebration of research. Most of the chart reviews and data collection is being completed currently. Our goal is to examine the incidence of recurrent pain, re-operation and fertility outcomes following laparoscopic surgery for pelvic pain.
