Utility of Screening Xrays in a Sports Medicine Clinic: recent studies have indicated that screening films for patients under the age of 40 are of low utility. The student in this project will be responsible for creating a database from prior medical records to assess the Xray ordering patterns between physicians who screen all patients and those who screen patients meeting set criteria to determine utilization, costs, and clinical efficiency. Depending on the progress of the student with this project, other projects using previously collected data or medical records may be available as time allows.
